

Site Install

For local development, below are instructions to install the site.

Install Drupal using "Minimal Install" profile

```
drush en -y environment_setup_dev

# The "theme" feature is not turning on the frontend theme as expected.
drush en -y kbooui
drush vset theme_default kbooui
drush vset site_frontpage home

# The "configure_admin_ui" feature is not enabling the admin theme as
expected.
drush en -y adminimal

# Some features have to be reverted from the outset.
drush features-revert-all -y --force

# Note, when running locally adjust the path to your local docroot.
drush scr
/home/sandbox/drupal-composer/kboo/web/sites/all/modules/custom/spin_up/kboo_spin_up/scripts/seed-taxonomies.php
drush scr
/home/sandbox/drupal-composer/kboo/web/sites/all/modules/custom/spin_up/kboo_spin_up/scripts/cull-ckeditor-profiles.php
drush scr
/home/sandbox/drupal-composer/kboo/web/sites/all/modules/custom/spin_up/kboo_spin_up/scripts/default-variables.php

# Clear cache
drush cc all
```

NOTE: Favicons must be uploaded via UI.

- In your local repo, confirm you have the file `{{favicons.zip}}` in `{{sites/all/themes/custom/kbooui/images}}`
- Go to `<site>/admin/config/user-interface/responsive_favicons`
- Under "Upload a zip file from realfavicongenerator.net to install", browse and upload that .zip file

Optional for local development but required for full site functionality

- Set Stream 1 node id at `/admin/config/station/streams` - this impacts the automated display of "What's on" as it checks the schedule associated with Stream 1
- Set `site_404` in Site Information to a node

Radio Station environment file

Create an environment file for Radio Station.

It should be at the following path and filename:

```
sites/all/modules/custom/utilities/radio_station/lib/configs/.env
```

It should contain either the word "local", "dev", "stage", or "prod" as appropriate.

Note, the local.php config file is gitignored and if working locally you will need to create a local version. There are many settings available in the local.php file, should you set the .env file to "local". This can be useful in troubleshooting issues on production or locally.

```
cp  
sites/all/modules/custom/utilities/radio_station/lib/configs/sample.local.  
php sites/all/modules/custom/utilities/radio_station/lib/configs/local.php
```
