

Audio stream ripper

When `radio_station_cron` executes:

1. The next 5 episodes within the next 25 hours are created if necessary and returned.
2. `atd` is set to run `StreamRipper` for any of those episodes that start within an hour of now and are not set to never archive.

Ripped files are saved to the path stored in the following drupal variable:

`radio_station_rip_filepath`

3. Next, any files found in the rip path above are moved to a sub-directory of the public files directory. The subdirectory is defined by the following drupal variable

`radio_station_rip_destination`

These files are then attached to the referenced episode's `field_audio_files` field

4. Other important Drupal variables used by this system are:

StreamRipper path: `radio_station_streamripper`

Stream uri: `radio_station_rip_stream`

5. The following config settings are defined by `radio_station` module. These are set per environment and are not stored in the database.

`cron_generate_episodes`: True/False

`cron_automatic_ripping`: True/False

`cron_attach_rips`: True/False

Note:

On the ServerPronto server this is currently the location of files. If you need to confirm this, ssh into the site and use `drush` to get the current variable values (or use `drush` locally with alias)

`radio_station_rip_filepath`: `/var/www/vhosts2/migrate.kboo.fm/web/sites/default/files/episode_audio_rip`

`radio_station_rip_destination`: `episode_audio` (`/var/www/vhosts2/migrate.kboo.fm/web/sites/default/files/episode_audio`)
