# Images

In general, users should upload the biggest images they can find. In some cases, we have limited the sizes that can be uploaded - either the low end, high end, or both.

**Main content image upload fields:**

- Lead images will be scaled and cropped to 300x225, and stay at that size regardless of viewport size.
  - It will crop to the center of the image, so if your image is portrait oriented and you want something other than the center of the image to be visible, you should resize the image before upload.
- Teasers of lead images will be resized to 150px wide, and auto height.
- "More" images will be scaled to 200px width, with auto height adjustment (so portrait images can remain long - they are not cropped)
- Gallery images are scaled and cropped to 560x420, and behave identically to lead images.

**Sidebars**:

- Images in sidebar are set to max-width 100% and auto height adjustment.
- At full desktop width, the images are 210px.
- At medium desktop width, they drop to 157.5px.
- On mobile, they will go full width (up to 740px or so), if they're big enough. So users should upload the biggest images they can find.
