Robots.txt

The default robots.txt file has been intentionally deleted. Support for robots.txt is provided by the radio_station module.

See Updating Drupal core for applying the patch that deletes the default robots.txt file.

By default the following content will be served for robots.txt

```
User-agent: *
Disallow: /
```

The following instructions explain how to override this for production.

Create the gitignored file with the following content

web/sites/all/modules/custom/utilities/radio_station/lib/configs/.env

```
prod
```

The content for the .env file informs which robots file to load and serve. By setting .env to "prod" the contents of following file will be served

web/sites/all/modules/custom/utilities/radio_station/robots/prod.txt

Note: The above file is not gitignored. However, as stated above, the .env file is gitignored. The .env file is not actually required. If it does not exist then the default robots.txt content will be served.
